

Having thus fully set forth the nature and merits of my invention,

What I claim as new is—

In a stove-drum or other equivalent parts of heating apparatus, the means employed, or their equivalent, for securing a permanent gas-tight joint between the ends of the cylindrical portions thereof and the end plates or other contiguous portions of said apparatus, consisting of the rings O and C, attached to or upon the ends of said cylinders A and B, respectively, and from thence projecting horizontally outwardly, for the reception of the cover E, in combination with said cover, and with suitable bolts G passing through said parts, substantially as shown and described.

In testimony that I claim the foregoing I have hereunto set my hand this 6th day of February, 1871.

MICHAEL G. FAGAN.

Witnesses:

W. P. ALLENBORN,  
AUG. P. COCHRAN.

and the top and bottom plates, so as to cause the heated escaping products of combustion to pass through the same and into an exit-pipe passing outward through the side or from the top of said drum, and thereby imparting a portion of their heat to the air surrounding the latter.

This device is, however, only shown for the purpose of illustrating my invention, which, as will be readily seen, is equally applicable to any portions of heating apparatus where it is desired to form a permanent joint between the end of a sheet-metal section or cylinder and a cast-metal cover.

The especial advantages possessed by this construction of a drum are—

First, the joint at either end is rendered entirely independent of and cannot be affected by the expansion or contraction of other parts of the device, and being made with very short bolts, is not liable to derangement from or by changes of temperature.

Second, each joint is horizontal, and no change of temperature or ordinary use of the heating apparatus can in any manner loosen or remove the cement, so that, if well made originally, said joints are certain to continue gas-tight while the metal remains intact.
